Developer Portfolio Generator (Markdown to Website)

Prepared by: Abinaya S (edit if required)

Introduction

A developer portfolio presents skills, projects and contact information in one accessible place. This project converts user-written Markdown into a themed portfolio webpage.

Abstract

Users enter portfolio content using a simple Markdown syntax. The application parses headings, paragraphs, lists, emphasis, inline code and links, then displays the result in a live preview. Users can switch between three themes and download the generated page as a standalone HTML file.

Tools Used

HTML5, CSS3 and vanilla JavaScript. A lightweight custom Markdown parser is used; no external library or hosting API is required.

Steps Involved in Building the Project

1. Designed an editor panel for Markdown input and a separate preview panel.
2. Implemented parsing for headings, paragraphs, lists, emphasis, code and links.
3. Escaped HTML input before rendering to reduce unsafe markup injection.
4. Added light, dark and mint themes with live switching.
5. Generated a standalone HTML document and implemented browser download.

Conclusion

The application demonstrates text parsing, live rendering, theme customization and client-side file generation. The parser supports the syntax described in the interface and is not a complete CommonMark implementation.
